

Established for over 35 years, we have focused exclusively on providing unbeatable office technology, and although we are a truly national operation, our success has been forged around our unique network of local offices providing on-the-spot response, rapport and reliability.

VOIP

Using Voice over Internet Protocol (VoIP), we can deliver your phone service through your internet connection, instead of through your analogue phone system. For businesses looking to make and save on long distance calls, VoIP is a cost effective option.

VoIP takes advantage of converging technologies such as high-speed broadband connections and faster data compression, to send more voice and video down existing copper wires and fibre connections. It's available from every part of the world – as long as you have an internet connection.

Our VoIP systems combine great functionality and ease of installation, with affordability, making it the perfect solution for businesses large and small, but particularly those with changing needs. Intuitive call queuing, parking and routing are standard features.

Save money, improve your efficiency

A VoIP solution dispenses with the need for costly hardware investment and ongoing maintenance fees. By re-routing your phone service, you can expect to save significant sums, whilst improving and expanding your global reach.

Your business will also enjoy a saving on its power consumption; this will also help to create a greener office environment.

Helping you to take control

All of our advanced VoIP telephony solutions can be installed and managed by you. This reduces the cost of ownership and the need for investment. In addition, we also offer a fully managed, off-site VoIP solution.

Altodigital VoIP features include: Microsoft Lync and Skype integration, voicemail to email delivery service, 3-way communication and intuitive call queuing.

How VoIP works

In simple terms, VoIP is a way of describing the delivery of voice communications over IP networks, such as the internet.

It has many benefits over traditional hard-wired networks – particularly given it integrates with your existing data lines. Effectively, voice traffic is digitised, compressed and released in secure IP data packets, and then routed in a similar way to internet-based traffic, usually to a central server, co-located in an approved data centre.

It's a completely scalable and secure solution that many businesses prefer given they can expand and adapt the technology to meet their future needs, without having to finance additional and costly hardware, maintenance etc.

Communication Solutions

Your business has to maintain constant and effective communication and connectivity – with your employees, agents, customers and suppliers. Any loss of efficiency can impact on your bottom line. Use our intelligent, technology-driven solutions to ensure your business keeps pace with today's global demands.

The Benefits

- Scalable – your voice communications can grow, as you do
- Save money, ie: maintenance fees, hardware, power supply
- Constant communication, irrespective of location
- Integrates with existing data lines
- Improves staff productivity and efficiency
- Saves money on long-distance calls
